# Welcome to our 12<sup>th</sup> Introductory Course in Genetic Counseling in Oncology 2023

Genetic counseling in oncology continues to gain importance each year. The results of genetic testing not only help in early diagnosis and prevention of cancer by medical or surgical means, but also increasingly influence the management of a growing part of cancer patients at various stages, just to mention the adjuvant treatment of breast cancer or the treatment of advanced prostate cancer with PARP inhibitors.

New developments such as the increasing use of genetic investigations of tumor tissue, new legal aspects, evolving scientific issues such as polygenic risk scores, evolving changing guidelines and a more individualized genetic counseling influence are mirrored in the content of our lectures and discussions. Even a repeat participation in the course will not only be a valuable repetition, but also introduce new concepts and developments.

This yearly introductory course combines current essential theoretical and practical knowledge presented by experienced specialists in this field, providing a platform for discussions with our distinguished faculty. It is a chance for networking with interested colleagues.

This SAKK course is organized by a scientific committee of the CPTC group and fulfills one of the requisites necessary for being listed as a genetic counselor allowed to order genetic tests.

Due to the necessary interactions, a format with a restricted number of participants and physical presence remains important. As a similar course will be held in English in western Switzerland by autumn 2023, we plan to keep the course in St. Gallen predominantly in German language.

On behalf of our scientific committee I invite you to this very informative, challenging and successful course as enhancement to your clinical skills or as a first basis for your own genetic counseling activity.

**Dr. Rudolf Morant,**  
Präsident Krebsliga Ostschweiz
